Post-Graduation Student Survey 38

Abstract

This technical report is part of SCOPE's Student-Centered Schools: Closing the Opportunity Gap study, which looks closely at four California high schools using one of two models—Linked Learning or Envision Schools—to achieve positive outcomes for all their students. These schools all successfully serve predominately low-income students and students of color through nonselective enrollment and embody many characteristics of student-centered learning. The full study uses qualitative and quantitative analysis to understand the impact of practices on student outcomes. This technical report shares results of three surveys administered to teachers, students, and school graduates to surface effective practices and long-term impacts of student-centered learning.

SCOPE thanks the American Institutes for Research (AIR) for their collaboration on this research. At the time of this study, AIR was conducting its Study of Deeper Learning: Opportunities and Outcomes (funded by the William and Flora Hewlett Foundation) and shared data and survey tools used in our research. Introduction

This technical report is part of SCOPE's Student-Centered Schools: Closing the Opportunity Gap study and provides data from a teacher survey, student survey, and post-graduation student survey conducted for this study.

The Student-Centered Schools study, funded by the Nellie Mae Education Foundation, looks closely at four California high schools that use either the Linked Learning or Envisions Schools model to achieve positive outcomes for their students. These schools all serve predominately low-income students and students of color.

Both of these models show clear evidence of engaging and developing high levels of proficiency for students of color, English learners, and low-income students at levels that far exceed traditional schools serving similar students. The schools in this study provide the types of learning experiences that prepare students for college and meaningful careers as well as graduating students of color, English learners, and low-income students at rates that exceed similar students in their districts and California.

The study focuses on the structures, practices, and conditions in four California high schools that enable students to experience positive outcomes and considers the ways in which these factors are interrelated and work to reinforce each other.

Methodology Overview

The Student-Centered Schools study addresses the following questions:

1. What are the effects of student-centered learning approaches on student engagement, achievement of knowledge and skills, and attainment (high school graduation, college admission, and college continuation and success), in particular for underserved students?
2. What specific practices, approaches, and contextual factors result in these outcomes?

The researchers employed mixed methods to look at the micro-level of classrooms and schools. Data collection for this study was conducted between March 2012 and September 2013.

Quantitative analysis was used to compare short- and long-term student outcomes in the case study schools with similar students in the same district as well as to analyze survey results of students, teachers, and graduates that are included in this report. Qualitative data-collection activities included formal interviews with administrators, teachers, students, parents, and community members; observations of instruction, advisory, professional development, teacher collaboration, student exhibitions and

defenses, community events and graduations; review of essential documents.

Survey Background

Teacher and student surveys were carried out in collaboration with the American Institutes for Research (AIR), which was conducting the Study of Deeper Learning: Opportunities and Outcomes (funded by the William and Flora Hewlett Foundation) at the time we were gathering our data.

Because the AIR study included two of the same schools that we were studying and the AIR survey closely aligned with our research goals, we used their teacher and student survey data from the overlapping schools and administered the same survey to collect data from the two schools in our study that were not included in the AIR study. For the two schools not included in the AIR survey, we added a few questions to the survey. Employing the AIR survey enabled us to draw on their full database for the study, which included a national comparison sample of 12 additional schools.

For the teacher survey data, the comparison sample comes from 356 teachers from 12 schools across the country. For the student survey, the comparison sample comes from 1,392 students from 10 schools across the country.

Post-graduation data were a critical component to understanding the long-term impact of the schools' practices. We surveyed and interviewed graduates from each school and tracked their higher-education enrollment through the National Student Clearinghouse.

Further details about the study methodology can be found in Appendix A of the cross-case analysis, *Student-Centered Schools: Closing the Opportunity Gap*, at <https://edpolicy.stanford.edu/publications/pubs/1200>.

More details on each of the schools studied can be found in individual case studies of each of the schools at <https://edpolicy.stanford.edu/publications/pubs/1175>

Teacher Survey Summary Data for the Study of Student-Centered Schools

For Q4 and Q8, Q5A, Q5D, Q5E, and Q5H, there are no data for schools B and C because those survey questions were only conducted in the Nellie Mae Study.
